The Miner.

"Here's word to all."—WASHINGTON.

ANALYTICAL CHEMISTRY AND ASSAYING.

PERFORMANCES OF ANALYTICAL AND ASSAY STATION.

Residues of Gold and Silver in the United States.

The Diamond Drill.

A correspondent wishes to know some details of the newly invented diamond drill, and bolder mining belonging to the Government, in recognition of the fact that these two industries yield metal, which two sides of coin have been found. The diamond drill, to some extent, has been used in prospecting for silver ore, and also, for the discovery of gold or silver. The cost for a ton is about $500 per ton.

It is to be noted that the cost of the assay is relatively high, and not, apparently, for the discovery of gold or silver. For this reason, the cost for a ton is about $500 per ton. We are given to understand, therefore, that the cost of the assay is relatively high.

It may be interesting to note the terms upon which the assay was performed. In summary: The original assay cost must be $500 per ton.

We have seen a few samples of this material, and of course, it is known that the cost of the assay is relatively high.
