The Improved Ford

Notable Improvements... now on display

THF Ford Model T—already famous for the value for which the cars are sold, now bears even greater improvements in strength and durability by important additions of new apparatus.

The new heavy steel Torque Tube surpasses the driving shaft and transmits all driving thrust from the engine to the rear wheels without the customary centre cross member of the frame. This relieves the rear springs of all but their normal function of absorbing the load, improves riding qualities, and lengthens the life of the rear springs.

The new sturdy steel Radius Rods support the torque tube in the function of keeping the machine from swerving or turning into a curve when thrust and maintain the year-round balance in perfect adjustment under all conditions.

These notable improvements greatly increase the Ford Truck's capacity for fast and economical performance under unusual difficult conditions and driving stress.

Offsetting Competition.

The progress for the development of this community to do its own and be independent to make its own products to engage and help to those whose looks and fame are distinct.

The names of the companies of the men of this community are the big names of the big men—those who see and dream and who are always ready.

The present is the way we face this competition for our local market to compete with them. For them to make up to the best, to make sure that we get business from this community.

A WORD TO THE PUBLIC.

When you need your money out of the community you must get along and improve this community. Strengthen—and keep—those who have founded this community. It will all be connected with the two main sources of money and wages.
